Melecular cloning and immunological characterization of the house dust mite allergen Der f 7."; [61995],
Clin. Exp. Allergy 25:1000-1006(1995),
-1- SUBCELLULAR LOCATION; Secreted.
-1- ALLERGEN: Causes an allergic reaction in human.
-1- SIMILARITY; Belongs to the mite group 7 allergen family,
                                                                                                                                                                             Dermatophagoides farinae (House-dust mite).
Bukaryota; Metazoa; Arthropoda; Chelicerata; Arachnida; Acari;
Acariformes; Sarcoptiformes; Astigmata; Psoroptidia; Analgoidea;
Pyroglyphidae; Dermacophagoidee.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Dermatophagoides pteronyssinus (House-dust mite).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       biosynthesis (By similarity):
-!-CATALYTIC ACTIVITY: L-glutamate = D-glutamate.
-!- PATHWAY: Peptidoglycan biosynthesis.
-!- SIMILARITY: Belongs to the aspartate/glutamate racemases family.
SEQUENCE FROM N.A.
Shen H.-D., Chua K.-Y., Lin K.-L., Hsieh K.-H., Thomas W.R.;
Shen H.-D., Chua K.-Y., Lin K.-L., Hsieh K.-H., Thomas W.R.;
Molecular cloning of a house dust mite allergen with common antibo
binding specificities with multiple components in mite extracts.";
Clin. Exp. Allergy 23:934-940(1993).
-!- SUBCELLULAR LOCATION: Secreted.
-!- AULERGEN: Causes an allergic reaction in human.
-!- SIMILERGEN: Causes an allergic reaction in human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEDLINE=22084549; PubMed=12089438; Tamas I., Klasson L., Canbaeck B., Naeslund A.K., Eriksson A.-S., Wernegreen J.J., Sandstroem J.P., Moran N.A., Andersson S.G.E.; "50 million years of genomic stasis in endosymbiotic bacteria."; Science 296:2376-2379(2002).

"Cloning and nucleotide sequences of the homoserine dehydrogenase genes (hom) and the threonine synthase genes (thrC) of the Gramnegative obligate methylotroph Methylobacillus glycogenes.";
Appl. Environ. Microbiol. 60:111-119(1994).
-!-CATALYTIC ACTIVITY: L-homoserine + NAD(P)(+) = L-aspartate 4-semialdehyde + NAD(P) L-spartate to homoserine; third step.
-!-PATHWAY: Conversion of L-aspartate to homoserine; third step.
-!-SIMILARITY: Belongs to the homoserine dehydrogenase family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Proc. Natl. Acad. Sci. U.S.A. 99:14434-14439 (2002).

-! FUNCTION: THIS IS A COMPONENT OF THE PHOSPHOENOLPYRUVATE-DEPENDENT SUGAR PHOSPHOTRANSFERASE SYSTEM (PTS), A MAJOR CARBOHYDRAITE ACTIVE—TRANSPORT SYSTEM. THE PHOSPHORYL GROUP FROM PHOSPHOENOLPYRUVATE (PEP) IS TRANSFERED TO THE PHOSPHORYL CARRIER PROTEIN HPR BY BNZYME I. PHOSPHO-PR THEN TRANSFERS IT TO THE PERWEASE (BNZYMES II/III). HPR IS COMMON TO ALL PTS.

-! BNZYME REGULATION: PHOSPHORYLATION ON SER-45 INHIBITS THE PHOSPHORYLATION CARRIER FROM BUSYME I TO HPR (BY SIMILARITY).

-! SUBCELLULAR LOCATION: Cytoplasmic.

-! SIMILARITY: Belongs to the Hpr family.

Eur. J. Biochem. 217:441-455(1993).

- I. Biochem. 217:441-455(1993).

- I. Biochem. 217:441-455(1993).

- I. FUNCTION: Regulates the GDP/GTP exchange reaction of the Rho proteins by inhibiting the dissociation of GDP from them, and the subsequent binding of GTP to them.

- I. FUNCTION: Raci P21/tho GDI heterodimer is the active component of the Cytosolic factor sigma 1, which is involved in stimulation of the NADPH oxidase activity in macrophages.

- I. SUBGUIT: FORMS A HETERODIMER WITH P21/RAC-1.

- I. SUBGELLUTAR LOCATION: Cytoplasmic.

- I. PTM: The N-terminus is blocked.

- I. SIMILARITY: Belongs to the Rho GDI family.

    subsequent binding of GTP to them (By similarity).
    SUBUNIT: Monomer (By similarity).
    SUBCRILLULAR LOCATION: Cytoplasmic.
    SIMILARITY: Belongs to the Rho GDI family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -> V (IN REF. 3)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Name=Beta-2;
Isold=003070-2; Sequence=Not described;
-!- TISSUE SPECIFICITY: Found in cerebellum and testis.
-!- DEVELOPMENTAL STAGE: Expressed specifically in late stage
spermatocytes. In the cerebellum, emergence of beta-2 isoform
coincides with granule cells maturation and exhibits postnatal
developmental increases. Expression is specifically reduced in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          weaver mutant.
-!- SIMILARITY: Contains 1 Rho-GAP domain.
-!- SIMILARITY: Contains 1 zinc-dependent phorbol-ester and DAG
binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Event=Alternative splicing; Named isoforms=2;

PROSITE; PS50862; AA TRNA LIGASE II; 1.
Aminoacyl-tRNA synthetase; Protein biosynthesis; Ligase; ATP-binding;

    -!- SIMILARITY: Belongs to class-II aminoacyl-tRNA synthetase family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryota, Metazoa, Nematoda, Chromadorea, Rhabditida, Rhabditoidea,
Rhabditidae, Peloderinae, Caenorhabditis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Submitted (OCT-2001) to the EMBL/GenBank/DDBJ databases.
-- FUNCTION: Not known. Putative receptor.
-- SUBGELLULAR LOCATION: Integral membrane protein (Potential).
-- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "Complice genome sequence of Vibrio vulnificus CMCP6.";
"Complice Genome sequence of Vibrio vulnificus CMCP6.";
Submitted (DEC-2002) to the EMBL/Genbank/DBD databases.
-!- CATALYTIC ACTIVITY: Nicotinate D-ribonuclectide + diphosphate nicotinate + 5-phospho-alpha-D-ribose 1-diphosphate.
-:- PATHAY: NAD biosynthesis; nicotinamide to NakN; second step.
-:- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-:- SIMILARITY: Belongs to the NAPRIESE family.

                                                                     Isoid=P52757-2; Sequence=Not described;
-! TISSUE SPECIFICITY: Highest levels in the brain and pancreas. A expressed in the heart, placenta, and weakly in the kidney and liver. Expression is much reduced in the malignant gliomas, compared to normal brain or low-grade astrocytomas.
-! SIMILARITY: Contains I Rho-Gap domain.
-! SIMILARITY: Contains I SH2 domain.
-! SIMILARITY: Contains I zinc-dependent phorbol-ester and DAG

J. Bacteriol. 184:4601-4611(2002).
-!- CATALYTIC ACTIVITY: L-arabinose = L-ribulose.
-!- PATHWAY: L-arabinose catabolism; first step.
-!- SIMILARITY: Belongs to the arabinose isomerase family.

                                                                                                                                                                                 Upeslacis E., Inler G.M.;
Submitted (AUG-1996) to the EMBL/GenBank/DDBJ databases.
-!-CATALYTIC ACTIVITY: ATP + L-alanine + tRNA(Ala) = AMP +
diphosphate + L-alanyl-tRNA(Ala).
-!-SUBCELLULAR LOCATION: Cytoplasmic.
-!-SUBCELLULAR LOCATION: Cytoplasmic.
-!-SIMILARITY: Belongs to class-II aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 HAMAP; MF_00036; -; 1.

                                                                                                                        The primary structure of the antenna polypeptides of Ectothiothodospira halophila. Four according antenna polypeptides in E. halochloris and E. halophila."; core-type antenna polypeptides in E. halochloris and E. halophila."; Eur. J. Biochem. 205:917-925(1992).

-!- PUNCTION: ANTENNA, COMPLEXES ARE LIGHT-HARVESTING SYSTEMS, WHICH TRANSFER THE EXCITATION ERREGY TO THE REACTION CENTERS.

-!- SUBJUNT: THE CORE COMPLEX IS FORMED BY DIFFERENT ALPHA AND BETA CHAINS, BINDING BACTERIOCHLOROPHYLL MOLECULES, AND ARRANGED MOST PROBABLY IN TETRAMBRIC STRUCTURES DISPOSED AROUND THE REACTION CENTER. THE NON-PIGMENTED GAMMA CHAINS MAY CONSTITUTE ADDITIONAL COMPONENTS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        characterization.";

-!- FUNCTION: ANTENNA COMPLEXES ARE LIGHT-HARVESTING SYSTEMS, WHICH
- TRANSTER THE EXCITATION BURBGY TO THE REACTION CENTERS.
-!- SUBUNIT: THE CORE COMPLEX IS FORMED BY DIFFERENT ALPHA AND BETA
CHAINS, BINDING BACTERIOCHLOROPHYLL MOLECULES, AND ARRANGED
MOST PROBABLY IN TETRAMERIC STRUCTURES DISPOSED AROUND THE
REACTION CENTER. THE NON-PIGMENTED GAMMA CHAINS MAY CONSTITUTE
ADDITIONAL COMPONENTS.

-!- SUBUNIT: F-type ATPases have 2 components, CF(1) - the catalytic core - and CF(0) - the membrane proton channel. CF(1) has five subunits: alpha(3), beta(3), gamma(1), delta(1), epsilon(1). CF(0) has three main subunits: a, b and c.
-!- SUBCELLULAR LOCATION: Chloroplast thylakoid membrane.
-!- MISCELLANEOUS: Dicyclohexylcarbodiimide (DCDD) inhibits ATPase.
-!- SIMILARITY: Belongs to the ATPase C chain family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MEDINE=9302112; PubMed=1404401;

MOI. Evol. 51:382-390(2000).

-!- CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate + H(+)(Out).

-!- SUBUNIT: F-type ATPases have 2 components, CF(1) - the catalytic core - and CF(0) - the membrane proton channel. CF(1) has five subunits: alpha(3), beta(3), gamma(1), delta(1), epsilon(1). CF(0) has three main subunits: a.b and c. b. and c. b. and c. SUBCELLULAR LOCATION: Chloroplast thylakoid membrane.
-!- SUBCELLANEOUS: Dicyclohexylearbodiimide (DCDD) inhibits ATPase.
-!- SIMILARITY: Belongs to the ATPase C chain family.
                                                                                                                                                               BY SIMILARITY.

Biol. Rep. 13:333-335(1995).

-!- CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate + H(+)(Out).

-!- CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate + H(+)(Out).

-!- SUBUNIT: F-type ATPases have 2 components, CF(1) - the catalytic core - and CF(0) - the membrane proton channel. CF(1) has five subunits: alpha(3), beta(3), gamma(1), delta(1), epsilon(1). CF(0) has three main subunits: a.b and c.

-!- SUBCELLULAR LOCATION: Chloroplast thylakoid membrane.

-!- MISCELLANBOUS: Dicyclohexylcarbodiimide (DCDD) inhibits ATPase.

-!- SIMILARITY: Belongs to the ATPase C chain family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               POTENTIAL.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -:-SUBUNIT: F-type ATPases have 2 components, CF(1) - the catalytic core - and CF(0) - the membrane proton channel. CF(1) has five subunits: alpha(3), beta(3), gamma(1), delta(1), epsilon(1). CF(0) has three main subunits: a, b and c. subcetiular LOCATION: Chloroplast thylakoid membrane.
-:- SUBCELIANEOUS: Dicyclohexylcarbodiimide (DCDD) inhibits ATPase.
-:- SIMILARITY: Belongs to the ATPase C chain family.
                                                                                                                                                                                                                                                                                                                                                                Chloroplast.
Eukaryota, Rhodophyta, Bangiophyceae, Porphyridiales, Porphyridiaceae,
Galdieria.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FEBS Lett. 304:119-123(1992).

-!- CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate + H(+)(Out).

-!- SUBUNIT: F-type ATFases have 2 components, CF(1) - the catalytic core - and CF(0) - the membrane proton channel. CF(1) has five subunits: alpha(3), beta(3), gamma(1), delta(1), epsilon(1). CF(0) has three main subunits: a, b and c.

-!- SUBCELDULAR LOCATION: Chloroplast thylakoid membrane.

-!- MISCELLANBOUGS: Dicyclohosylcarbodiimide (DCDD) inhibits ATPase.

-!- SIMILARITY: Belongs to the ATPase C chain family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 61 DICYCLOHEXYLCARBODIMIDE (BY SIMILARITY) 83 AA; 8180 MW; B41F6C0ABA086493 CRC64;

-!- FUNCTION: NDH-1 shuttles electrons from NAD(P)H, via FNN and ironsulfur (Fe-S) centers, to quinones in the respiratory chain. The immediate electron acceptor for the enzyme in this species is believed to be plastoquinone. Couples the redox reaction to proton translocation (for every two electrons transferred, four hydrogen ions are translocated across the cytoplasmic membrane), and thus conserves the redox energy in a proton gradient (By similarity).

-!- CATIVITY: NAD(P)H + plastoquinone = NAD(P)(+) +
                                                                                                                                                                                     Q -> L (IN REF. 1 AND 3; AAK48082)

         -i- FUNCTION: The glycine cleavage system catalyzes the degradation of glycine. The H protein shuttles the methylamine group of glycine from the P protein to the T protein (By similarity).
-i- COPACTOR: The H chain contains a covalently-bound lipoyl cofactor (By similarity).
-i- SUBUNIT: The glycine cleavage system is composed of four proteins: P. T. L and H (By similarity).
-i- SUBUNIT: Selongs to the gcvH family.
-i- SIMILARITY: Contains 1 lipoyl-binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SEQUENCE FROM N.A.

Weber R.E., Fago A., Val A.L., Bang A., Van Hauwaert M.-L.,

Dewilde S., Zal F., Moens L.;

Insohemoglobin differentiation in the bimodal-breathing amazon

catish Hoplosternum littorale.;

J. Biol. Chem. 275:17297-17305 (2000).

-!- FUNCTION: Involved in oxygen transport from the lung to the

various peripheral tissues.

-!- FUNCTION: Involved in oxygen transport from the lung to the

various peripheral tissues.

-!- FUNCTION: Involved in oxygen transport from the lung to the

catish PRECIPICITY: Red blood cells.

-!- MASS SECTROMETRY: WM=15978; MW BRR=0.2; METHOD=Electrospray.

-!- MASS SECTROMETRY: WM=15978; MW BRR=0.2; METHOD=Electrospray.

-!- MISCELLANEOUS: This fish has two hemoglobins: cathodic and anodic.

-!- MISCELLANEOUS: This fish has two hemoglobins: cathodic and anodic.

-!- SIMILARITY: Belongs to the globin family.

A complete sequence of T. tengecongensis genome.";
Genome Res. 12:689-700(2002).
-!- FUNCTION: This enzyme is involved in nucleotide metabolism: it
produces duWp. the immediate precursor of thymidine nucleotides
and it decreases the intracellular concentration of dUTP so that
uracil cannot be incorporated into DNA By similarity).
-!- CATALYTIC ACTIVITY: dUTP + H(2)0 = dUMP + diphosphate.
-!- PATHWAY: De novo synthesis of thymidylate.
-!- SIMILARITY: Belongs to the dUTPase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          STRAIN=S288C / AB972;

"Human IL-3 (multi-CSF): identification by expression cloning of a novel hematopoietic growth factor related to murine IL-3.";
Cell 47:3-10(1986).
-!- FUNCTION: GRANULOCYTE/MACKOPHAGE COLONY-STIMULATING FACTORS ARE CYTOKINES THAT ACT IN HEMATOPOIESIS BY CONTROLLING THE PRODUCTION, DIFFERENTIATION, AND FUNCTION OF 2 RELATED WHITE CELL POPULATIONS OF THE BLOOD, THE GRANULOCYTES, AND THE MONCYTES-MACROPHAGES.
-!- FUNCTION: THIS CSF INDUCES GRANULOCYTES, MACROPHAGES.
STEM CELLS, ERYTHROID CELLS, EOSINOPHILS AND MEGARARYOCYTES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -!- SUBUNIT: Monomer.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Activated T cells, mast cells, natural killer

MAGA21 is a receptor for mitochondrial targeting sequences and cooperates with MOM19 ";
EMBO J. 14:4204-4211 [1995].
-!-FUNCTION: Central component of the receptor complex responsible for the recognition and translocation of cytosolically synthesized mitochondrial preproteins. Together with TOM20 functions as the transit peptide receptor at the surface of the mitochondrion outer membrane and facilitates the movement of preproteins into the translocation pore. Docks TOM20 and TOM70 for interaction with the general TOM40 import pore (GIP) complex. May regulate the TOM machinery organization, stability and channel gating (By
                                                                                                                                                                                                                                                                                                                                                                                                 01-FEB-1995 (Rel. 31, Created)

Mitochondrial import receptor subunit TOM22 (Mitochondrial 22 kDa
outer membrane protein) (MOM22 protein) (Translocase of outer membrane
TOM-22 OR TOM22 OR MOM22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SUBUNIT: Forms part of the receptor complex that consists of at least 8 different proteins (TOMS, TOMS, TOMY, TOMY, TOMY, TOMY, TOMY, TOMY, TOMY, TOMY AND TOMYO), Interacts with TOMYO and TOMYO (By similarity). SUBCELLULAR LOCATION: Type II membrane protein. Mitochondrial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            "The mitochondrial receptor complex: a central role of MOM22 in mediating preprotein transfer from receptors to the general insertion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             outer membrane.

DOMAIN: Its cytoplasmic domain associates with the cytoplasmic domains of TOM20 and TOM70. Its intermembrane space domain provides a trans binding site for presequences and the single membrane anchor is required for a stable interaction between the GIP complex proteins (By similarity).

SIMILARITY: Belongs to the Tom22 family.
                                                                                                                                                                                            Gaps

"He synthesis of autoinducer 2 (AI-2) which is secreted by bacteria and is used to communicate both the cell density and the metabolic potential of the environment. The regularion of gene expression in response to changes in cell density is called quorum sensing. Catalyzes the transformation of S-ribosylhomocysteine (RRC) to homocysteine (HC) and 4,5-dihydroxy-2,3-pentandione.

Rapid evolution of a unique family of primate ribonuclease genes.";
Nat. Genet. 10:219-223(1995).
-! PUMCTION: Tilis is a non-secretory ribonuclease. It is a pyrimidine specific nuclease with a slight preference for U. Cyctotoxin and helminthotoxin. Possessa a wide variety of biological activities.
-! CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside 3'-phosphates and 3'-phosphate intermediates.
with 2',3'-cyclic phosphate intermediates.
-! SUBCELDUAR LOCATION: Lysosomal (Probable); matrix of eosinophil's
